

Barley Poultry Feed (Green or Powdered)

Benefits

Poultry thrive on fresh vegetation. Feeding fodder will result in higher profitability and healthier birds.

Incorporating fodder into poultry diets will result in these benefits:

- Better quality eggs with deeper yolk colour
- Enhanced egg taste
- Reduced sticky droppings
- Higher quality meat with better texture
- Improved health
- Relaxed temperament

Reducing Poultry Feed Costs & Maintaining Good Health!

Hydroponically grown fodder can be produced for < R1/kg and is a good supplement to an existing diet to reduce overall feed cost. It is a good choice for poultry producers to consider! Sprouted fodder contains all of the essential nutrients, vitamins and minerals needed for optimal meat and egg production. SGF Fodder Feed Systems allow any size poultry operation to grow their own feed year round in a climate controlled unit, with minimal labour. Feeding fodder to poultry, from broilers to layers, will significantly reduce feed costs and improve the quality of poultry products.
